ABSTRACT OF THE DISCLOSURE

1

A method of producing transfer stickers with metal powder has the steps of: 2 coating a substrate with a first isolating layer; coating the first isolating layer with a 3 resin layer; coating the resin layer with a metal powder layer by an electroplating 4 process; printing a first protecting resin layer pattern on the metal powder layer; 5 etching the metal powder layer for shape and to cause the patterns to protrude; 6 washing away the etching reagents; printing a second protecting resin layer on the 7 first protecting resin layer to protect the patterns in shape; printing an adhesive layer 8 on the second protecting resin layer; and then attaching a second isolating layer to the 9 adhesive layer. The transfer sticker made in accordance with this method has 10 exquisite patterns that can be transferred completely without other residual parts of 11 the sticker. 12
